

# SUMMARY SHEET

THE DECENTRALISED AUTONOMOUS ORGANISATION

## The Decentralised Autonomous Hedge Fund Summary Sheet

The Decentralised Autonomous Hedge Fund is a new type of Blockchain innovation. It uses 2 tokens. One is called Coeval (COE) and another is called Monkey (MNY). Both are CoinMarketCap listed tokens.

The COE DAF works like this:

1. Put in ETH
2. Get back COE
3. The COE selling goes up in real time according to the same prices as Ethereum did
4. Some of the ETH is used to buy more COE which is stored in a separate wallet
5. When all COE are issued then remaining COE will be used to buy the reserve wallet
6. Meanwhile, COE can be used as an option to purchase MNY at a discount

The discount that COE purchases MNY to relative to other crypto is:

$$\begin{aligned}(MNY/COE)-(210) &= x \\ (x/210) &= y \\ y+\$1 &= z\end{aligned}$$

The MNY DAF works like this:

1. Put in your crypto
2. Get back MNY
3. The MNY selling goes up in real time according to the same prices as Bitcoin did
4. When the tokens are all issued send in your token and get a like-for-like % of all crypto that was used to purchase the MNY
5. When all MNY are issued then they can be used to buy the assets that purchased them on a like-for-like % basis
6. The MNY token that is used to make the re-purchase goes back to the original MNY miners – so even if you have sold your MNY before then, it doesn't makes no difference: everyone who mines it gets their MNY back in the end
